DETERMINATION OF THE SUPER-ELLIPTIC SHAPE OF TIRE-SOIL CONTACT AREA USING IMAGE PROCESSING METHOD

R. FARROKHI TEIMOURLOU, H. TAGHAVIFAR

ABSTRACT. The present study is aimed at determination of the super-elliptic shape of tire-soil contact area using image processing method. Contact area has a substantial role on determination of soil compaction and tractive parameters of agricultural tractors. A very well-known model in this realm is to describe the contact area with superellipse geometry. A soil bin testing facility equipped with a single-wheel tester was utilized to conduct the needed experiments. The experiments were carried out at three levels of wheel load, three levels of tire inflation pressure with three replicates in a completely randomized block design. Corresponding images were taken for each of the experiments and the images were processed accordingly. The contact length and width were determined using imdistline command in MATLAB commercial software. This experiment was conducted at three levels of wheel load (2, 3, and 4 kN), and three levels of tire inflation pressure (100, 200, and 300 kPa) with three replications. The aforementioned parameters were applied consequently in the superellipse model and the contact area was computed. The obtained results disclosed that increase of wheel load increases the contact area. Contradictory, increment of tire inflation pressure reduces the formed contact area. Additionally, the potential of contact area determination with the proposed model was compared with that of actual values, which denoted coefficient of determination equal to 0.96, which shows the promising ability of the proposed model and the appropriateness of describing contact area with superellipse geometry.

GIS-BASED FLOW ROUTING WITH THE DISTRIBUTED HYDROLOGICAL WETSPA MODEL IN THE ZIARAT RIVER BASIN - GORGAN, IRAN

N. JAVIDAN, A. BAHREMAND

ABSTRACT. The GIS-based distributed hydrological model, WetSpa, whose flow routing method is described in this paper is suitable for flood prediction and watershed management on catchment scale. The model predicts outflow hydrographs at the basin outlet or at any converging point in the watershed, and it does so at a user-specified time step. The model is physically based, spatially distributed and time-continuous. This paper focuses on the GIS-based diffusive transport approach for the determination of rainfall runoff response and flood routing through a catchment. The watershed is represented as a grid cell mesh, and routing of runoff from each cell to the basin outlet is accomplished using the first passage time response function based on the mean and variance of the flow time distribution, which is derived from the advection–dispersion transport equation. The flow velocity is location dependent and calculated in each cell by the Manning equation based on the local slope, roughness coefficient and hydraulic radius. The hydraulic radius is determined according to the geophysical properties of the catchment and the flood frequency. The total direct runoff at the basin outlet is obtained by superimposing all contributions from every grid cell. The model is tested on the
Ziarat _Gorgan watershed with 4 years of observed hourly rainfall and discharge data, and the results are in excellent agreement with the measured hydrograph at the basin outlet.

**EVALUATION OF PHYSIOLOGICAL TRAITS, YIELD AND YIELD COMPONENTS AT TWO GROWTH STAGES IN 10 DURUM WHEAT LINES GROWN UNDER RAINFED CONDITIONS IN SOUTHERN SYRIA**

**ABSTRACT.** Water stress, which limits the distribution and productivity of durum wheat (*Triticum durum* Desf.) in the Mediterranean region, is also considered to be a major factor reducing yield in semi-arid regions. Improving drought resistance is thus an important objective in plant breeding programs for rainfed agriculture. The current study was carried out to identify drought-tolerant durum wheat lines among 10 lines and one variety (Douma1, the control) in the first and second settlement zones in the Southern part of Syria and to recognize the most important physiological parameters associated with drought tolerance. Membrane stability index, chlorophyll (chl) content, relative water content and chl fluorescence were recorded at the vegetative and anthesis stages, as were yield and yield components. Data recorded at vegetative and anthesis stages in both zones showed that there were significant differences between all lines growing in the first and second settlement zones and that all characters in the second zone were significantly lower than those in the first zone. Line 1 was superior to Douma1 in terms of membrane stability index, relative water content, chl content and chl fluorescence, also showing better yield and higher total plant biomass, tiller number/m², 1000 grain weight and grain number/ear than the control. The ability of wheat cultivars to perform reasonably well in variable rainfall and water-stressed environments is an important trait since it allows for stable production under drought stress. Moreover, prior to genetic manipulation, it is important to characterize the physiological parameters of known drought-tolerant or drought-sensitive wheat cultivars with the objective of better understanding their physiological responses under drought.

**Abbreviations:** $F_\text{v}/F_\text{m}$ (Maximum quantum yield of PS II derived form chlorophyll fluorescence measurements); MSI (membrane stability index); RWC (relative water content); TGW (1000 grain weight).

**Key words:** Chlorophyll; $F_\text{v}/F_\text{m}$; Membrane stability; Rainfed; Relative water content; Wheat; Water deficit
ANALYSIS OF ALLELIC VARIATION IN HMW-GLU-1 GENE BLOCKS IN IRANIAN WHEAT CULTIVARS USING ALP MOLECULAR MARKER

Y. SHIRI, M. SOLOUKI, M. FOROOTAN

ABSTRACT. In order to study the allelic variation of Glu-1 gene (High molecular weight glutenin), 100 Iranian wheat cultivars including imported and domestic genotypes were analyzed using ALP-PCR technique. Four specific primer pairs were used based on the genetic loci of Glu-A1, Glu-B1, and Glu-D1 to perform the chain polymerase reactions. PCR reaction products were resolved on 2% agarose gel. Since allele “a” had the largest relative frequency (0.707), two alleles (a 344bp; b 362bp) were identified by P1-P2 primer for Glu-A1 locus. Three alleles (a 800bp; b 500bp; c 300bp) were detected for Glu-B1 locus by P5-P6 primer, and allele “b” was assumed as the highest relative frequency (0.618). Two primer pairs were applied for Glu-D1 locus. Ultimately, four alleles were identified, where allele “c” had the highest relative frequency (0.525). The observed genetic variation value for Glu-D1 locus (H=0.648) exhibits the maximal polymorphism. Using cluster analysis, the relationship between the observed polymorphism and geographical variation was investigated. The results indicated that there exists a remarkable variation in Glu-A1 locus between the Iranian wheat cultivars.

Key words: Allelic variation; ALP; Genetic distance; Glutenin.

THE CHANGES OF GERMINATION CHARACTERISTICS AND ENZYME ACTIVITY OF BARLEY SEEDS UNDER ACCELERATED AGING

S. A. TABATABAEI

ABSTRACT. Seed aging is the main problem of seed storage. Changes of enzyme activity and reduction of seedling growth are consequence of seed deterioration. An experiment was conducted to evaluate the effects of accelerated aging on germination indexes and enzyme activity of barley seeds. Seeds were incubated in closed plastic boxes for the accelerated aging treatments at 41°C. Three accelerate aging regimes were performed by placing seeds at 41°C and relative humidity (RH) of 90-100 % for 0, 4 and 8 day periods. Our results showed that increasing aging duration resulted higher reduction in germination percentage, germination index, mean time to germination, normal seedling percentage, catalase and ascorbate peroxidase. The highest germination percentage, germination index, normal seedling percentage and enzyme activity were achieved in control conditions (0 day of aging). Under aging conditions, germination percentage, means time to germination, germination index, normal seedling percentage and enzyme activity decrease significantly. Also, our results indicated that seed aging is related to decrease of enzymes and may contribute to low germination efficiency. The general decreases in enzyme activity in the seed lowers the respiratory capacity, which in turn lowers both the energy (ATP) and assimilates supply of the germinating seed, also decrease in antioxidant enzymes is linked to an increased accelerated ageing and decreased germination characteristics. Subsequently, proposed a positive relationship between antioxidant enzyme capacity and the vigour of the seed.

Key words: Germination characteristics; Enzyme activity; Barley seed; Aging.
STUDY OF GERMINATION AND SEEDLING GROWTH OF BLACK CUMIN \((\text{Nigella sativa L.})\) TREATED BY HYDRO AND OSMOPRIMING UNDER SALT STRESS CONDITIONS

A. AHMADIAN, Y. SHIRI, M. FROOZANDEH

ABSTRACT. The objective of the study was to determine the responsible factors for germination and early seedling growth due to salt toxicity or osmotic effect and to optimize the best priming treatment for these stress conditions. To study the effect of osmopriming and hydropriming on germination and seedling growth of black cumin \((\text{Nigella sativa L.})\) under salt stress conditions this experiment was conducted at Torbat-Heydariyeh University, Torbat, Iran. The treated seeds (control, hydropriming and \(\text{ZnSO}_4\)) of black cumin were evaluated at germination and seedling growth for tolerance to salt \((\text{NaCl and Na}_2\text{SO}_4)\) conditions at the same water potentials of 0.0, -0.3, -0.6, -0.9 and -1.2MPa. Electrical conductivity (EC) values of the \(\text{NaCl} \) solutions were 0.0, 6.5, 12.7, 18.4 and 23.5 dSm\(^{-1}\), respectively. Results showed that hydropriming increased germination and seedling growth under salt stress. Germination delayed in both solutions, having variable germination with different priming treatments. In \(\text{NaCl} \) treatment, germination percentage, root and shoot weight, shoot and root length were higher but mean germination time and abnormal germination percentage were lower than \(\text{Na}_2\text{SO}_4\), at the same water potential. The root / shoot weight and R/S length enhanced with increase of osmotic potential in both \(\text{NaCl} \) and \(\text{Na}_2\text{SO}_4\) solutions. \(\text{NaCl} \) had less inhibitor effect on seedling growth than the germination. It was concluded that inhibition of germination at the same water potential of \(\text{NaCl} \) and \(\text{Na}_2\text{SO}_4\) resulted from salt toxicity rather than osmotic effect. The findings of this experiment can be useful and applied to achieve best germination and uniform emergence under field conditions for farmers of medicinal plants.

Key words: Black cumin \((\text{Nigella sativa L.})\); Salt stress; \(\text{ZnSO}_4\); Priming; Seedling.

EFFECT OF SOME TREATMENTS ON SEED DORMANCY, GERMINATION AND ANTIOXIDANT ENZYMES OF \text{Kelussia odoratissima} MOZAFF. SEEDS

A. HASSAN SHAYKHI, B. MAJD NASSIRY, M. ATAEI KACHOUEI

ABSTRACT. Seed dormancy provides a mechanism for plants to delay germination until conditions are optimal for survival of the next generation. Dormancy release is regulated by a combination of environmental and endogenous signals with both synergistic and competing effects. In many cases, viable seeds are called dormant, when they are simply not germinating. \text{Kelussia odoratissima} Mozaff. (wild celery) is a medicinal plant (kind of umbelliferous) of Iran. Seeds of \text{K. odoratissima} often germinate poorly in the nursery, because of their seeds have a dormancy. Thus shortening the dormancy and increasing germination with laboratory methods can be effective in restoring the plant. The objective of this research was to evaluate the effect different methods of breaking of dormancy on germination of \text{Kelussia odoratissima}. Experiments used were stratification (0, 3, 6, 9 and 12 weeks), stratification and gibberellin and stratification and nitrate potassium. Results showed that stratification, stratification and gibberellin and stratification and nitrate potassium increased germination characteristics and catalase and ascorbate peroxidase activity. The highest germination percentage, seedling length, seedling dry weight and catalase and ascorbate peroxidase activity were attained from
stratification and gibberellin 500 ppm and stratification and nitrate potassium 1%. In general, results showed that stratification and gibberellic acid (500 ppm) is the best treatment for breaking of Kelussia odoratissima Mozaff. seed dormancy and in seeds antioxidant enzymes could trigger germination.

**Key words:** Antioxidant enzymes; Breaking of dormancy; Germination; Kelussia odoratissima; Dormancy.

**EFFICACY OF INSECTICIDES AGAINST CITRUS PSYLLA (DIAPHORINA CITRI KUWAYAMA) IN FIELD AND LABORATORY CONDITIONS**

M. QASIM, D. HUSSIAN

**ABSTRACT.** The experiments were conducted in a citrus orchard to check the efficacy of insecticides against citrus psylla, and mortality was observed after three days, seven days and then after one month. Four insecticides, Polytrin-C, Talstar, Bifenthrin and Imidacloprid applied, had an almost equal effect on the population reduction of citrus psylla on all citrus plants. The trial was laid out in randomized complete block design (RCBD) having five treatments with three replications in a citrus orchard, after three days of spray showed percentage control as 96.91%, 94.33%, 93.83% and 93.06% of following insecticides Polytrin-C, Imidacloprid, Bifenthrin and Actara, respectively, calculated by Minitab 15. Psylla adults were exposed to different concentrations (500, 400, 300, 200 and 100 ppm) of Imidacloprid and Bifenthrin, and two controlled conditions (with leaves and without leaves). Both Imidacloprid and Bifenthrin insecticides proved to be the most effective against D. citri with lethal times (LT50s) of 4 and 5 hours, respectively, at a concentration of 500 ppm, calculated from probability test with Minitab-15.

**Key words:** Citrus psylla; Percentage control; Imidacloprid; Bifenthrin.

**POTENTIAL HONEY BEE PLANTS OF EGYPT**

H. F. ABOU-SHAARA

**ABSTRACT.** There are various plants with potential feeding importance to honey bee, *Apis mellifera*, colonies as source of pollen, nectar or both. Selection of suitable regions for apiaries mainly depends on the availability of honey bee plants in the apiary region. Identifying honey bee plants in specific region is very essential for honey and pollen production from honey bee colonies. Lacking the information about the beneficial plants for honey bees including; plant name, flowering time and potential benefit to honey bee colonies could be considered as a limitation for beekeeping development. So far honey bee plants are not well studied in Egypt. This review paper presents potential honey bee plants in Egypt using the available publications. The studies on honey bee plants in Egypt were also reviewed. This work can be considered as a guide for beekeepers and researchers. Moreover, the presented plants here can
be used in comparing honey bee plants of Egypt with other countries to get a better understanding of honey bee flora. More detailed investigations on honey bee plants are strongly required to be done at all Egyptian Governorates.

**Key words:** Apis mellifera; Pollen; Nectar; Foraging; Honey.

**PERFORMANCE ASSESSMENT IN BUSINESS OF AGRICULTURAL COMPANIES USING BALANCED SCORECARD MODEL**

S. BREZULEANU, Carmen Olguța BREZULEANU, I. BRAD, T. IANCU, A. CIANI

**ABSTRACT.** The performance management is a strategic and integrated approach for long-time success of the activity of agricultural companies, by improving the performance of the organization, teams and individuals. In search of success, the performance management uses a variety of models, techniques and methods, some taken from other systems and improved and others of its own, focusing on strategy and differentiating features that provide a strong competitive advantage. The Balanced Scorecard (BSC) model identifies several dimensions of the organization, representing areas where organizations need to achieve results at department, team or individual level. According to the type of the agricultural company, there can be essential financial aspect, customers, internal processes, knowledge and learning, service quality, market share etc. The company under study, S.C. Agrocomplex Lunca Pașcani S.A., is representative in terms of ownership, farm and profile of the agricultural production in Moldavia region. According to the methodology developed, starting from the strategy of S.C. Agrocomplex Lunca Pașcani S.A. we identified the strategic objectives for each situation and the level of reaching the objectives using several indicators. In the second stage of the BSC analysis, the indicators are defined according to the management priorities of S.C. Agrocomplex Lunca Pașcani S.A. in four categories, corresponding to the four dimensions of the classical model: customer perspective, perspective of processes within the company, employee perspective and financial perspective.

**Key words:** Agricultural company; Performance management; Balanced Scorecard (BSC) model.

**REZUMAT.** Estimarea performanței în afaceri a societăților agricole utilizând modelul Balanced Scorecard. Managementul performanței reprezintă o abordare strategică și integrată a asigurării succesului de durată în activitatea societăților agricole, prin îmbunătățirea performanței organizației, echipelor și indivizilor. În căutarea succesului, managementul performanței utilizează o diversitate de modele, tehnicii și metode, unele preluate de la alte sisteme și perfecționate și altele proprii, cu accent pe strategie și pe elemente de diferențiere puternice care să ofere un avantaj față de concurență. Modelul Balanced Scorecard (BSC) identifică mai multe dimensiuni ale organizației, reprezentând zone în care organizațiile trebuie să obțină rezultate la nivelul departamentelor, echipelor sau indivizilor. În funcție de tipul societății agricole, dimensiunile esențiale pot fi: aspectul financiar, clienții, procesele interne, cunoștințele și învățarea, calitatea serviciului, cota de piață etc. Asociația luată în studiu, S.C. Agrocomplex Lunca Pașcani S.A., este reprezentativă în ceea ce privește forma de proprietate, de exploatație și de profil a producției agricole în zona Moldovei. Conform metodologiei elaborate, pornind de la strategia S.C. Agrocomplex Lunca Pașcani S.A., sunt identificate
obiective strategice pentru fiecare situație în parte, iar gradul atingerii obiectivelor este măsurat cu ajutorul unor indicatori aleși. În a doua etapă a analizei Balanced Scorecard, indicatorii sunt delimitați în funcție de prioritățile conducerii S.C. Agrocomplex Lunca Pașcani S.A. în patru categorii, corespunzătoare celor patru dimensiuni ale modelului clasic: perspectiva clienților, perspectiva proceselor din întreprindere, perspectiva angajatului și perspectiva financiară.

**Cuvinte cheie:** societăți agricole; managementul performanței, modelul Balanced Scorecard (BSC).
