

Studiul unor caractere cantitative la câteva cultivare de fasole pentru pastai cu creștere determinată (*Phaseolus vulgaris* l. var. *nanus*) în generația mutagenă m2

Violeta SIMIONIUC, C. LEONTE, M. CALIN - USAMV Iasi

The experiment was made in 1997, with from four varieties of pod beans: Cape, Valja, Galben\ de Moldova and Atlantic, who was irradiated with gamma rays. The purpose of the experiment is to identify the new possibilities for increase some quantitative characters of these varieties. In this paper, we presented the results obtained in M2 mutagen generation.
