

Evoluția modului de folosință a terenurilor și producțiile obținute la principalele culturi din incinta Albița – Fălciu, județul Vaslui, în primii 16 ani după executarea lucrărilor hidroameliorative.

O. TOMITA, F. FILIPOV, S. JITAREANU - USAMV Iași

The land utilization category and the land improvement measures are the main criteria used in the lowest category (soil variant), of the Romanian soil classification. In this paper we present the modification of land use in the dammed area Albița - Fălciu after 16 years of the execution, of land improvement works (drainage, irrigation, deep loosening). In this period the surface of arable land increased and the and the medium obtained crop production showed with some exception the beneficial influence of land improvement on the physical and chemical soil properties.
