

Efectul erbicidului icedin-super asupra structurii organelor vegetative de *Galium aparine* L. (fam. Rubiaceae)

Mihaela NIȚĂ - Universitatea "Al. I. Cuza" Iași

In this paper the response of the species taken into account to the treatment with the herbicide Icedin-Super is concerned. Its effect on different tissues explains some modifications produced by the action of herbicide substance. Many of the plants from investigated species were destroyed by herbicide action early enough, from the seedling stage. Our research refers to plants, which could grow, their structural modifications induced by the herbicide having small amplitude and being only quantitative.
