

Productivității culturilor pe luvisolul albic pseudogleizat din Podișul Sucevei

D. SCURTU, I. SATCO - S.C.A. Suceava

The evaluation of the registered data in the first experimental cycle realized on the rainy white soil from the northern area situated at the bottom of the mountain (Suceava Tableland) underlines the following: the period of the prolonged action of only one year of the lupine (green additive) and of the manure; the favorable influence of the calcification on the biodegrading capacity of the micro flora and the doubling of the indicator of trophic state of the ploughed sub layer.
