

## Researches regarding the selectivity of different herbicides applied for weeds control in wheat crops

M. ZAHARIA, T. ONISIE, G. JITAREANU, L. RAUS - USAMV Iasi

Take into consideration the importance of wheat crop and its large area of cultivation, the problem of chemical weeds control, it continues to present interest both through the world and in our country. With the exception of classical substances (2,4 D and Dicamba) new active ingredients have been synthesized in the recent years with a somehow different spectrum of action, doses and epochs of application. With this paper we intend to study the influence of five herbicides applied at two different times and two wheat varieties on the weeding degree and yield.
