

Cercetari privind modul de folosire si sistemul de fertilizare la pajistile permanente de *Agrostis capillaris* din regiunea de deal a Olteniei

IONESCU I., OSICEANU M. - Universitatea din Craiova

The yields of the majority of the natural meadows from the hilly area of Oltenia are small and mediocre as regards their quality. Research done has demonstrated that annual doses of chemical fertilizers (100 N 50 P₂O₅ 50 K₂O) applied on fields amended with 6 t/ha CaCO₃ are increasing the yield at over 5 t/ha dry matter. The improved meadows can be used through mowing or through browsing with sheep and bovines.
