

La dynamique, sur phases de végétation, de la consommation journalière
d'eau des plantes agricoles irriguées, cultivées sur les sols
argileux de la prairie de la rivière prut

The paper presents, for the pedoclimate conditions of the meadow of Prut river, the main vegetation phases and the value of the daily water consumption, both in the moment of the achievement of the considered vegetation phase and in the periods between the phases. Such an approach of the problem permit us to describe the dynamics of the daily water consumption, with the outrunning of the limits imposed in the current practice of analyses with monthly medium values, which do not surprise efficiently the transfer of the soil moisture during the vegetation season.
