

The improvement of the permanent meadow. A way to equilibrate the fodder balance

V. VINTU – USAMV Iasi

In Romania the pastures cover a land surface bigger than 4.8 mill. ha and provide some 40% of the need of green fodder and 25% of the hay. About 250.000 ha of these pasture are found mainly on slopes from silvosteppe and are degraded by erosion and by irrational exploitation. They produce a poor forage yield, about 2-3 t/ha d. m.
