

Cercetări morfo-biometrice la specii de leguminoase cultivate în condiții experimentale

Maria-Magdalena ZAMFIRACHE, C. Toma -
Universitatea "Al. I. Cuza" Iași

It was been studied, from statistical point of view, some aspects of radicular nodules of leguminous plant cultivated species as effect of symbiosis process with some bacteria nitrogen fixing species from Rhizobium genus. We observed positive or negative correlations between the morpho-anatomical characters and chemical and biological treatments.
