

Modificări fiziologice și histo-anatomice induse de poluanți atmosferici la unele specii lemnoase de angiosperme

Maria-Magdalena ZAMFIRACHE, Lăcrămioara IVĂNESCU - Universitatea "Al. I. Cuza" Iași

In this paper we present the critical situation of three species of Angiosperms (*Fagus sylvatica* L., *Quercus petraea* (Matt.) Liebl. and *Quercus robur* L.), which can be found in areas of industrial zone from Bicăz District, Romania. The pollutants are mainly solid . lime and cement dust. Our investigation it is about the physiological and histo . anatomical modifications of the leaves (needles).
