

Research on the pollination particularities at certain species of the iris genus

T. ROBU, Doina Liana TOMA, C. MILICA, Doina JITAREANU - USAMV Iasi

During their evolution, the iris species specialized continuously in for the entomophilic pollination. The eco-climatic different conditions have determined the presence of some various insects, which pollinate the Iris species originating from a certain area. The work aims to present the morphological modifications of the inflorescence at species coming from distinct areas to encourage an efficient entomophilic pollination.
