

## Influence of density on some productivity traits in Millet (*Panicum miliaceum* L.)

PRICOP M. - Agricultural Research and Development Station of Podu-Iloaiei  
CREȚU L. – USAMV Iasi

During 2000-2002, with different climatic but favourable years, to main and sequential millet culture, experiments have been conducted at the Agricultural Research and Development Station of Podu-Iloaiei on the influence of density on some productivity traits in three millet genotypes. Two densities have been used with rare rows between them (50 cm), using 90 to germinating seeds/m<sup>2</sup> and thick rows of 12.5 cm between them, using 360 germinating seeds/m<sup>2</sup>. Significant diferentions were noticed as oncerns the variability of some productivity traits, both withn the genotypes and between them, in both ways of culture.
