

Researches concerning the relations between phenotype characteristics of Chick-Pea - breeding methods

A. F. BADIU – S.C. ITC S.R.L. Bucuresti

The researches between the phenotype characteristics of chick-pea was made for the identification of phenotypically markers with low variability, with the purpose to be utilized in the breeding works of increasing the seed yield productivity and the amilopectinis content. The study of these relations we are permitted to elaborate a sequential breeding strategy and to valorize the intra-populations variability of chickpea germoplasma sources.
