

Establishing the degree of phenotypical similarity among the bicane variety as maternal genitor and its descendants by means of the cluster analysis

Liliana ROTARU, C. TÂRDEA - USAMV Iasi

The Bicane variety was used as maternal genitor in the creation of 8 new Romanian varieties: Select, Roz românesc, Greaca, Silvania, Xenia, Tamina, Donaris and Paula. The authors have used the Cluster Analysis to determine the phenotypical similarity among the Bicane varieties genitor and its descendants, with a view to establish the polyphyletic groupings among the biological material under analysis.
