

Hibridul timpuriu de porumb Decebal

DUTU H. - S.C.D.A. SUCEAVA

The paper presents the maize hybrid DECEBAL, created at Agricultural Research and Development Station of Suceava and homologated in 2003. The average results of three experimental years (2000 – 2002) obtained at S.C.D.A. Suceava, for morphological characters presentation and the results obtained in ISTIS center for physiological features and yield capacity. The results show that the hybrid DECEBAL could complete the current assortment of early hybrids recommended for culture in more humid and colder zones in the country.
