For obtaining of the high yielding to the fodder kohlrabi it is necessary the creating of the new genotypes with high yielding capacity, resistant to the pest and diseases and of course very resistant to the winter storage. This species has a good capacity for improving of the agrophytotechnical factors. In this paper I will present the new fodder kohlrabi varieties MONTANA, which was created in year 2004. The Montana varieties is characterized by a higher yield capacity then other varieties which are in the present in crop production, a good quality emphasized by a high dry substance content, high protein content, a low percent of cellulose and a good resistance to the diseases especially to the viruses.
