

## AGRICULTURA BIOLOGICA- PREZENT SI PERSPECTIVE Organic farming, PRESENT AND FUTURE

SAMUIL C. - USAMV Iasi

People's desire to consume agricultural products as healthy as these can be, doubled by the energetic crisis unleashed in the 90's, made possible the development of the system of biological agriculture, which solves all these problems. This system of agriculture doesn't mean replace the other systems, but means to be regarded more as a opportunity which is addressed to the those producers and consumers who are aware of its benefit.

As of Romania is going to become a member of the EU, we consider that it is a very good opportunity for this system to be more known, having in view the quite high requirements of ecological products on the EU market.
