

WINES QUALITY DIFFERENCES DETERMINATES BY CLIMATE CHANGES CALITATEA VINULUI DIFERENTE DETERMINATE DE SCHIMBARILE CLIMATICE

Gabriela TEODORESCU - Valahia University of Targoviste

Global warming could have a detrimental effect on wine from the warmer regions. Grapes are a good indicator crop, because the majority of wines grapes are grown almost exclusively in narrow temperate or Mediterranean zones and growers and consumers alike are very scrupulousness in their rating of quality. Wine grapes provide a particularly good indicator of how climate can affect a grape harvest, that season's vintage and by extrapolation the impact on other crops in the same region
