

INUNDAȚIILE DIN ȚARA NOASTRA ȘI MASURILE CE SE IMPUN PENTRU REDUCEREA EFECTULUI LOR DISTRUCTIV FLOODS IN OUR COUNTRY AND THE WAY REQUIRED TO REDUCE THEIR DESTRUCTIVE EFFECTS

DINU Gabriela - Universitatea "Valahia" Târgoviste

Climatic and hydrological condition in our country lead to periodical floods of more or less importance. The paper presents flood development conditions and their harmful effects in the last years.

Flood events are being counterbalanced by in damming structures (approximately 9500 km) and certain storage lakes (about 13,6 km). It is required a number of further protection works (and in particular of lakes for flood attenuation), maintenance of the riverbeds and flow improvement. It is also advised that any structure erected in flood land zones should be provided with flood protection works and organized for the struggle against flood effects. A better advertisement technique is proposed through flood periods as well as a closer survey of the protection works and an improved operation of storages.
