

Optimizarea structurii culturilor cerealiere în zona de sud a județului Prahova

Oana-Adina GUTU, A. BANU, R. F. GUTU - C.C.A. Prahova, Ploiesti
Elena GINDU - USAMV Iasi

The optimization of cereal crops appears as a consequence of the necessity to programming the vegetal production in territorial profile for the purpose of a reasonable use of natural resources, where the arable territory had occupied a primordial place.

During the period 1999-2002 in the southern zone of Prahova district, the cereals for grains occupied on average 72% from the arable cultivated field, as a result of the fact that 34,5% from the arable surface was identified in the category of a medium quality. In the purpose of optimization of cereal crops structure in the southern zone of Prahova district, the authors proposed to recommend the best solution in order to ensure the optimum consumption needs of the population from the studied area to emphasize the availability for the internal or external market of cereal species, which have the most favourable pedological-climatic conditions.
