

## The common influence of stable garbage as well as of the chemical fertilizers upon the variation of the production on the cultivated maize on the brownreddish soil from S.D.E. Craiova, Banu-Maracine farm

STEFAN M. - Universitatea din Craiova

The researches have been made between 1994-2000, on a brown-reddish soil from the central area of Oltenia, Banu-Maracine farm, as part of the University from Craiova, without irrigation. It has been watched the isolated effect of the favorable elements (organic fertilizers and chemical fertilizers), but also the effect of the interaction between them in the achievement of the production headway at the maize. The two forms of fertilizers applied to the maize are capable to inculcate upon the production a bigger variation, from which we can spotlight those interactions that are favorable.
