

Sistemele de managementul mediului și aplicarea politicii ambientale

Marilena MIRONIUC - Universitatea "Al. I. Cuza" Iași

New instruments for the knowledge and control of the interactions manifested among the activity of various organizations, and the environment, have been recently elaborated, along with the organizations' substantiation of ambiental policies oriented, on one hand, towards economic and financial objectives, and towards the protection and preservation of the existing environment, on the other. Among such instruments is the system of ambiental management, applied for the realization, maintenance and continuous improvement of the ambiental performances (concentration values of their own polluting emissions), according to pre-established organizational standards. The study presents the main – both theoretical and practical - preoccupations and concerns of the specialists, of the European and international organisms for creating the instruments necessary for an efficient management of the ambiental resources, in parallels with the presentation of the advantages and costs afferent to controlling the interactions occurring between the organizations' activity and the environment. There are described the European and international regulations forming the legal framework for the implementation of an ambiental management system, along with the procedure for the elaboration of an efficient management system, integrated with the other compounds of the managerial system. These two aspects are essential elements, supporting the efforts made by Romania – now actively engaged in the implementation of the communitary acquits, referring to Chapter 22, Protection of the environment, as a preparation step towards its U.E. integration.
