The presentation of the public information system on natural and technological hazards for Romanian farmers contains the results of analysis on natural and technological hazards in Romania, the structure, the functionality aspects as well as the more or less specialised users' interfaces. The modern, quick, direct solution of an information portal on hazards for agricultural producers needs a huge effort in knowledge management as well as for an user-friendly public presentation. This solution is proposed as an alternative of the existing ones and as an information support for the national system for emergencies. To understand the complexity of this tool the paper presents the Romanian hazards, the structure, and functionality and general recommendation for public use of this information portal.
