This paper presents the opinions about the methods of collection and transport of household wastes in an integrated economic system, and then a method of determining the economical way of transport is shown in the case of a vehicle with certain practical values. Further on, the ways of transport in an advanced economic sanitation system are presented concerning the collection and transport of household waste in which waste treatment and use have already been integrated. Proposals are made concerning Harghita County with regard to the limitation of the regions served by depositing areas and estimates are drawn up based on statistic data concerning the number of households, the quantity of waste they produce, and the regional depositing areas serving the latter. Finally, proposals are made for the placing of transshipping stations and the limitation of regions served by them.
