

The characterization of some wheat varieties tilled in the suceava plateau, from the viewpoint of the bakery qualities

E. ZEAMA, C. DROBOTA - S.C.D.A. SUCEAVA
Ana LEAHU - The "Stefan cel Mare" University Suceava

The development of the amelioration works at the Research Station from Suceava in the last years, conducted to the creation of some winter wheat lines; some of them with good bakery qualities.

The most representatives and well-adapted 10 genotypes are characterized.

The qualitative value of the lines, from the point of view of the chemical proprieties and the bakery quality, and the correlations between them are analyzed.

The obtained experimental data for the raw material (the flour quality indexes) and the finite product (backing samples) revealed the wheat lines quality tested in the bakery.
