The goal of this work paper is to identify and appreciate all beekeeping resources from Constanța County, in order to establish and estimate the future possibilities for optimal capitalization of it. It was studied the forest melliferous vegetation from Constanța Forest Department, with the four local offices, the territory allocation of agriculture production of melliferous crop plants, of vine plants, meadow and pasture plants. It has been determined the intervals and favorability of honeybee harvesting, the beekeeping weight issue by melliferous base from Constanța County, the establishing of honey bee families number which economically can be kept in the researched area. This study demonstrates the uncovering of the whole melliferous potential of Constanța County, recommending the repartition of an important supplementary number of honey bee families, in correlation with the territory allocation of the most important described melliferous basins.
