The most important of A. C. Cuza's works was „Despre populație. Statistica, teoria și politica ei” (About population. Its statistics, theory and politics), published in 1899, re-edited and completed in 1929. It is a detailed study of population, containing elements of demography and statistics. The first part of the study deals with issues concerning demography and statistics, while the second deals with the importance of using statistical methods

The statistics of population is one of the three branches of „the science of population”; population is described by statistical means, using the following variables: gender, age, marital status, profession, education, religion, nationality, etc. The author supplements scientific results with statistic data of his time.
