By the way of the land use adjustment, in the public interest, lots are spatially and functionally structured, they are consolidated or divided and their accessibility and utilization is supported to create conditions for rational farming. Recently need of soil, water and landscape conservation, protection of homes and remedy of harms caused by large – field farming in last years and more given to the foreground. In our poster we present two different approaches to solving of plan of common arrangements in modelling territory, which is endangered with water erosion and frequent floods: a purely technical approach and an ecological approach. From the results it is evident, that both of these ways of solving may function separately, however they are extreme cases. The consensus of mentioned approaches is always better.
