

## Influenta fertilizării cu vinassa asupra producției de furaj pe pajisti permanente din podisul Moldovei

A. IONEL, Irina TALPAN, Mihaela BALAN, Mihaela RUSU - USAMV Iași

The researches made regarding the influence of vinassa about the forage production bring an important contribution regarding the usage of this organic by-product to the permanent meadows from the Moldova Plane. At the permanent meadows, the administration of vinassa in doses of 2-7 t/ha and also associated with phosphorus fertilizers had a great influence on the forage yield. The fact that the forage production had been big and with a better quality, proves that the availability of the administration of organics fertilizers and the fact that vinassa brought the biggest production increments, proves that this is an important organic fertilizer and with a great economic efficiency to the fertilization of permanent meadows.
