

Reventul - planta legumicola recomandată pentru fermele mici și mijlocii

Adriana DUTA, Rodica SOARE, O. PANITA - Universitatea din Craiova

For the increasing of the rhubarb harvest in Romania, a perennial vegetable plant, that has nutrient and therapeutic importance, there were taken in study five varieties that were harvested by using the transplant method. The experimental results shows that in two years from the founding of the harvest there were yielded rhubarb stalks of good quality. So, by average, the leaves number/plant was from 16-28 cm, the stalk length was from 35.3-58.5 cm, the broad was from 1.23-1.97 cm and the weight was from 4.2-126.1 g. Regarding the biochemical composition, the studied hybrids had values from 4.1-7.8 % SUS, 5.5—11.5 % SUT and 485-943 ppm nitrogen components. Wandine Red and Strawberry varieties surpassing the others cultivars regarding the market quality and the nutrient value of the stalks.
