

Aspects of the interrelationships between some agrochemical characteristics of the brown luvic soil from the west of the Suceava plateau

Ana LEAHU, D. SCURTU, I. M. RISCA - The "Stefan cel Mare" University Suceava

The determinations fulfilled at the soil samples drowned off from the experimental field placed onto the brown luvic soil from Ilișești point out a very great variability of the interrelationships between the main agrochemical characteristics of the soil.

This variability was generated not only by the nature of the used fertilization resources but also by the crop efficiency.

In the paper there are showed numerous specific features of those interrelationships, evaluated by means of the correlation coefficients, in the years with significant crop differences – big, medium and small.
