

Projection of culture structures in the field area

I. BRAD, T. IANCU, Cosmina-Simona TOADER - USAMVB Timișoara

In the plain area, which is most suited for agricultural cultures, the structure of cultures was planned for the two differentiated areas. Within the module of 25 hectares, the grains represent 52.6%, the technical plants 12% and the fodder plants 35.4%. We mention that in fodder category we also included fodder barley, reason for which this culture does not have a distinct position, and it is included in fodder plants. In the maximum productivity variant a profit of 12,494 lei is obtained and an average profit of 451 RON/ha. For the module of 50 hectares the total profit for zone 1 is 27,834 RON and 556 RON/ha, while for zone 2 24,884 RON and 498 RON/ha.
