

Studiul comportării unor soiuri de mar în cultura intensivă din zona pomicolă de nord a Republicii Moldova

R. SAGANEAN - Universitatea Agrară de Stat din Moldova

The experiment was effectuated in the orchard of the society S.A "Alfa-Nistru" established in Spring 2000. There have been studied 4 varieties of apple-trees such as: Pinova, King Ionagold, Champion, Gala Must grafted on the rootstocks M9. Determination of the optimal cuttings system is a major problem that influences on the productivity and phytometric characteristics of the apple-trees. Highest yield was obtained at the varieties: King Ionagold and Gala Must 38 -44 t/ha; Pinova 37 - 43 t/ha; Champion 34 - 41 t/ha.
