

Influența desimii de semănat asupra producției la rapiță (*Brassica napus* L. ssp. *oleifera* D.C.)

MORAR Florica - Colegiul Agricol "Tr. Săvulescu", Tg.-Mureș

In an experience realized on S.C.P.B. Sângeorgiu de Mureș on spring rapeseed, has been observed that the broadcasting density with 300 germinative seeds/m² has been obtained the bigger production of seeds (1930 kg/ha), and the interaction between fertilizer x variety x broadcasting, relived the variant fertilized with N90 P90 K90, Heras variety and density with 300 germinative seeds/m², which productions was 2700 kg/ha. Heras variety proved that it can be more productive than Bolero variety.
