

Cercetări privind evoluția unor dimensiuni corporale la tineretul mascul cabalin din rasa Shagya

DOLIȘ M. – USAMV Iasi

This scientific paper is part of a larger project, that aims the growing and develop process of young horses. Based on the corporal measures made after birth, 3 months, 6 months, 1, 2 and 3 years, we observed the main grow values evolution in young horses, males from Shagya race in the conditions offered by Rădăuți horse herd. From the many types of measures made in this direction, in this work we analised only the 3 dimensions that are more important specialy in horse selection activities: waist, toracical perimeter and tibia perimeter. The presented data in this paper are compatible with the ones in the speciality literature, indicating that Rădăuți horse herd offers good conditions for the growing of Shagya race.
