

Problematika gestionării deșeurilor în județul Dâmbovița

ELEKES Carmen, ROBESCU Ofelia - Universitatea "Valahia" Targoviste

The industrial progress of the last decades made such as the waste resulting from production and after consuming of products to be more and more various and in much bigger quantities; this generate the necessity of a rigorously management of waste accumulation. Solid waste from urban area are stored on casual platforms, nearby towns, in a simple manner, without any control methods of soil, surface and underground waters pollution and without any prevent measures of possible environmental risks. Beside domestic waste in this accumulation areas are accepted, at law limit, industrial waste, mixture that can conduct to the creation of highly toxic substances which increase the environmental risks. The domestic and industrial waste dumps influence environment's aspect by seriously degradation of landscape and of soil structure. In Dâmbovița County, although don't exist treatment installations for urban waste, in county area operate authorized economic agents that collect plastics, paper and metal waste from population.
