

Dezvoltarea agriculturii biologice în condițiile aplicării politicii agricole

MIHAI C. - Universitatea "Al. I. Cuza", Iași

Organic agriculture represents an economic sector of significant dynamics over the last years. European states have encouraged the development of the agricultural sectors that are environmentally friendly and that offer the quality products desired by consumers. Common Agricultural Policies reforms have brought to the attention of European countries the need for the rational use of natural resources and environmental friendly technologies application. At present, there are many instruments and support measures for the development of organic farms: price support instruments, rural development programmes, agri-environmental measures, investment support for the conversion of traditional farms into organic farms, process systems and market tools to for the products obtained with environmentally friendly technologies, training programmes for farmers with the goal to initiate and develop organic productions, incentives for farms in less favored area, research in agriculture so as to improve productivity and competitiveness etc. In this paper, we propose to identify the advantages of adequate strategies in the organic agriculture domain.
