Abstract

Pain and inflammation management in the medical field are necessary in every pathology regardless of the origin. When it comes to the veterinary field, pain and inflammation reduction is the key to full recovery, considering the animal patient's behavior in such cases. Also, because the medication may in some cases be inaccessible or hard to be administered, veterinarians and owners should take alternative medicine into account, as many literature researches had indicated high efficacy. This research aims to analyze the latest discoveries regarding the inflammation and pain management through curcumin treatment.

Keywords: musculoskeletal; pathology; alternative; medicine; curcumin; inflammation; pain.
